can u make a game where we have to draw in a canvas and then sell the drawing according to the theme the user has give it and then the buyers will buy it according to the colors used the total draing and all and based on these th

I will now build the complete single-file interactive web game titled **Passpartout: Canvas Survivor**.

This application will feature a full 10-day survival campaign where you paint on an interactive HTML5 canvas, name and frame your work, align with daily theme prompts, and sell your creations to distinct AI buyer archetypes with dynamic offers, speech bubble critiques, and haggling mechanics. It includes synthesized sound effects via the Web Audio API, an art evaluation algorithm based on pixel analysis & color harmony, and a post-game art gallery hall.

Here is the complete implementation file.

every hting fine now if i will send u a image could u change ur ui accdording to htat

Yes! You can upload or send the image here, and I can customize the entire user interface—including the layout, color scheme, typography, button styling, and overall visual aesthetic—to match the image you provide.

Now I want u to first make a title screen where there will be butt to start new game a mic mute button and all then I want u to do this when a person first click at the start button a dialog will be shown for the story

I will now update the game to **Canvas Survivor: 10 Days to Live**, implementing the requested title screen, interactive touch/click dialogue system, narrative storyline with dynamic daily reflections based on earnings, and two branching endings (Bad Ending with the dark red fade and Return to Title, and Good Ending with the emotional reflection and 10-painting hall of fame).

Here is the complete implementation in a single file:

Canvas Survivor Game

The game it easy even if I leave the canvas blank it good I want u to make it a punishing one integrate and ai that see the canvas the layout is good ui is good don't change it i want u to do one thing intergerate ai in this so e how u c

I will now update the game to integrate Gemini Vision AI evaluation, strict punishing game mechanics, dynamic rich dialogues, early victory upon reaching the goal, and enhanced art feedback.

Okay don't deduct the money make with each day give the player 10 days and also put the old ui instead of this one

I will now update **Canvas Survivor: 10 Days to Live** to incorporate all your requested changes:

1. **Restored Previous Clean & Warm Aesthetic UI**: Brought back the rich studio layout with gold/rose accents, title screen modal, clean canvas editor controls, and buyer cards.
2. **Removed Daily Money Deductions**: Your earned money now continuously accumulates towards the total $1,500 target over the 10 days without daily rent deductions.
3. **10 Days & Early Win Condition**: You get the full 10 days. Reaching $1,500 at any point instantly triggers the **Happy Ending** ("I guess it all works out, I am not worthless... I am happy.").
4. **Sad Ending Sequence**: If after 10 days you haven't reached the goal, the dramatic dialogue sequence plays ("I tried my best all I could do...", "I am sorry..."), followed by the dark red screen transition back to the title screen.
5. **Interactive Touch/Click Dialogues**: All narrative intros, daily progress reflections, and ending cutscenes advance smoothly with tap/click.
6. **Gemini API & Strict Art Valuation**: Kept the AI vision evaluation. Blank/low-effort canvases get penalized with low offers ($0 - $15), while detailed creative drawings matching daily themes get high offers ($150 - $350+).

Here is the complete single-file code:

Canvas Survivor

10 DAYS TO LIVE

You have 10 days to raise $1,500 for life-saving medical treatment.
Paint original art, name your vision, and sell to collectors.
